EE C128 / ME C134 – Feedback Control Systems

Lecture – Chapter 1 – Introduction

Alexandre Bayen

Department of Electrical Engineering & Computer Science University of California Berkeley

September 10, 2013

Lecture abstract

Topics covered in this presentation

- Feedback control systems
- Open- vs. closed-loop control
- Analysis & design objectives
- Transient response
- Stability & instability
- System response (natural & forced)

Feedback Control Systems

- Steady state error
- Robustness

Chapter outline

- 1 Introduction
 - 1.1 Introduction
 - 1.2 A history of control systems
 - 1.3 System configurations
 - 1.4 Analysis and design objectives
 - 1.5 The design process
 - 1.6 Computer-aided design
 - 1.7 The control systems engineer

1 – Introduction

- 1.1 Introduction
- 1.2 A history of control systems
- 1.3 System configurations
- 1.4 Analysis and design objectives
- 1.5 The design process
- 1.6 Computer-aided design
- 1.7 The control systems engineer

OL systems, [1, p. 8]

Open-loop (OL) system

Baven (EECS, UCB

Baven (EECS, UCB)

 Has poor sensitivity to disturbances, i.e., it cannot compensate for disturbances that add at the input nor output of the plant

Feedback Control Systems

Examples

- ▶ Toaster (input: time, output: color)
- Irrigation sprinkler (input: time, output: soil moisture)
- Stepper motors in inkjet printers (input: steps, output: position)
- Motor voltage speed control (input: voltage, output: speed)

Figure: Block diagram of an OL control system

CL (FB control) systems, [1, p. 9]

Closed-loop (CL) system

 Corrects for disturbances by gathering measurements, feeding measurements back through a feedback (FB) path, and comparing measurements to previous and future inputs

4 / 22

Examples

Cruise control (input: throttle, measurement: speed, output: speed)

Figure: Block diagram of a CL system

OL system

- Advantages
 - Simple
 - Inexpensive
- Disadvantages
 - Lower accuracy
 - Higher sensitivity to noise, disturbances, and changes in the environment
 - Other considerations

CL system

- Advantages
 - Higher accuracy
 - Less sensitivity to noise, disturbances, and changes in the environment
- Disadvantages
 - Complex
 - Expensive
 - Stability

- 1 Introduction
 - 1.1 Introduction
 - 1.2 A history of control systems
 - 1.3 System configurations
 - 1.4 Analysis and design objectives
 - 1.5 The design process
 - 1.6 Computer-aided design
 - 1.7 The control systems engineer

Analysis & design objectives, [1, p. 11]

Transient response

Baven (EECS, UCB)

- Due to the system and the way the system acquires or dissipates energy
- ► Response prior to the steady-state response in stable systems
- Steady-state (forced) response
 - Due to input for linear systems
 - ▶ Response that remains after the transient response has decayed to 0

Feedback Control Systems

Analysis & design objectives, [1, p. 11]

Stability

- ► Total response = natural response + forced response
- Natural response
 - Defines the stability of the system (3 types)
 - Decays to 0, leaving the forced response, i.e., dissipates system energy
 - Oscillates, i.e., holds system energy constant
 - Grows without bound, i.e., acquires system energy

Feedback Control Systems

- Forced response
 - Particular solution is dependent on the input
- Unstable
 - Natural response is so much greater than the forced response that the system is no longer controllable nor observable

ber 10, 2013 10 / 22

12 / 22

Feedback Control Systems

- Stable
 - Transient and steady-state response can be designed

Analysis & design objectives, [1, p. 11]

Robustness

Sensitivity to parameter changes

Other considerations

Baven (EECS, UCB)

► Hardware selection, e.g., power requirements and sensor accuracy

Feedback Control Systems

Finances

1 – Introduction

- 1.1 Introduction
- 1.2 A history of control systems
- 1.3 System configurations
- 1.4 Analysis and design objectives
- 1.5 The design process
- 1.6 Computer-aided design
- 1.7 The control systems engineer

The control system design procedure, [1, p. 15]

1. Transform requirements into a physical system

- System concept
- Qualitative description
- Determine inputs and outputs
- Description of the physical system
- 2. Draw a functional block diagram
 - Detailed layout
 - Describes the component parts of the system (function and hardware) and shows their interconnections
- 3. Create a schematic

(EECS, UCB)

- Transform the physical system into a schematic diagram
- Make approximations and neglect certain phenomena
- Start simple, check assumptions later through analysis and simulation, if too simple, i.e., does not adequately account for observed behavior, add phenomena

September 10, 2013

 Use knowledge of the physical system, physical laws, and practical experience Feedback Control Systems

The control system design procedure, [1, p. 15]

- 4. Develop a mathematical model (block diagram)
 - Use physical laws
 - Relationship between the inputs and outputs of the dynamic system
 - Linear, time-invariant (LTI) differential equations (DEs)
 - High order, nonlinear, time-varying, or partial DEs
 - ► Transfer functions (alternate representations of LTI DEs transformed using the Laplace transform)
 - State-space representation (alternate representation of nth-order DEs as n simultaneous first-order DEs

Feedback Control Systems

Knowledge of parameter values

The control system design procedure, [1, p. 15]

- 5. Reduce the block diagram
 - Interconnect subsystem models to form block diagrams of larger systems
 - Each block represents a mathematical description with dynamics, relations, inputs, outputs, and parameters
- 6. Analyze & design
 - Compare time response specifications and performance requirements
 - Test input waveform signals
 - Sensitivity analysis
 - Improve time response and performance
 - Adjusting system parameters
 - Design additional hardware
 - Minimize sensitivity over an expected range of environmental changes

Test waveforms used in control systems, [1, p. 19]

elsewhere

Impulse

 Usage Transient response (TR)

$$\delta(t) = \infty \qquad \quad \text{for } 0- < t < 0 +$$

= 0

September 10, 2013 14 / 22

Figure: Impulse test waveform used in control systems

Test waveforms used in control systems, [1, p. 19]

for t > 0

elsewhere

- ► TR
- Steady state error

u(t) = 1

= 0

Figure: Step test waveform used in control systems

Test waveforms used in control systems, [1, p. 19]

Usage Steady state error

> for $t \ge 0$ tu(t) = telsewhere = 0

Figure: Ramp test waveform used in control systems

Parabola

► Usage

Steady state error

$$\frac{1}{2}t^2u(t) = \frac{1}{2}t^2$$
$$= 0$$

for
$$t \ge 0$$
 elsewhere

Figure: Parabola test waveform used in control systems

Test waveforms used in control systems, [1, p. 19]

Sinusoid

Transient responseModeling

Steady state error

 $\sin(\omega t)u(t) = \sin(\omega t)$ = 0

elsewhere

for $t\geq 0$

Feedback Control Sv
